

Git Quick Help

Get a git repository from GitHub to a pc

This command must be executed **in the parent folder** where you want this new cloned repository to be cloned into like in the Document folder of a Windows PC.

```
# the git url can be obtained from the git repository  
# in the browser by clicking on the green button labeled  
git clone <git url>
```

Set Git to remember user credentials for folder under git control

```
git config credential.helper store
```

Save updates added or changed in a folder already under git control

The following commands must be executed **in the repository folder** previously cloned from GitHub.

```
# add veryting not under git control to be under git control
git add .
# check the status of git - optional
git status
# commit everything added
git commit -m "comment for the submission"
# synchronise the committed updates with GitHub using push
git push
```

update a current git repository with the latest updates on GitHub online.

This command must be executed **inside the repository folder**.

```
git pull
```

Create a git server
